## POULTRY.

W.M.—The barley corns you refer to are a brewer's product, the sprouts of malted barley, and known in the poultry world as "barley" and sometimes "barley meal." It is not malt dust. They are most suitable for mixing with the feed of all birds, and especially of the young. It is a digestive and other properties which constitute them so valuable for the poultry man.

W.M.—I have been told that the Continent advertised last Saturday's issue of the "Herald."

W.M.—Your Oregonians are doing us well with their eggs. I have seen only one from the only one from the Philippines, Micrones, or Andalusians will be satisfactory.

The arrangements of the poultry society at the Bathurst A. M. and P. Society's show have been very successful and the public has been pleased. To suit the convenience of the public instructions have been issued that all exhibitors must be present the day prior to judging.

The Illawarra Poultry Club held a meeting on five days ago, when Mr. W. C. Murray was present. There was in place of Mr. Hurwood, who retired. There was a proposal that only show birds be shown, which was defeated. A discussion arose over the question of the exhibition of the Hindman, which is now of great importance, seeing that the French can now be so successfully recognised by breeders, that two exhibitors showing them at last year's exhibition. It is quite possible that the Hindman may be relegated to the variety class.

The management of the Waverley Agricultural and Pastoral Association has issued the following regulations for the show to be held at the place on the 21st and 22nd of next month. The majority of the breeds are provided for, and several special prizes awarded for the best of the various classes. The show. Mr. M. H. Woolley continues to be the secretary.

W.M.—The notice is noted for its good table and poultry, and there is no doubt the superiority of the birds being shown. It is a pity that the encouragement given to that section by the Agricultural Society, which this year has been the largest, is not more prominent. It is a pity that the show, beginning on the 22nd of next month, is not the best 13 fowls at the show. It is the same amount for six fowls, and a number of other attractive amounts. The fancy section is the most attractive, and the prizes offered in each class is scarcely sufficient to attract the exhibitor.

immunities from whatever cause arising. In cases of BAD LEGS, SKIN AND BLOOD DISEASES, and SORES of all kinds, its effects are marvellous. It is also a powerful remedy for RHEUMATIC PAINS, for it removes the cause from the system.

It is pleasant to the taste, and warranted free from any other evil. From infancy to old age, and in all climates, it is equally valuable. Thousands of cures have been effected by its curative powers of this splendid medicine.

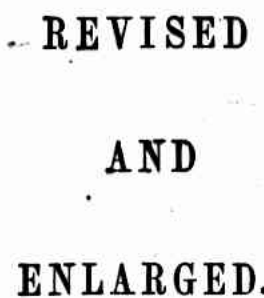

**ECZEMA AND IRRITATING SKIN DISEASES.**  
**TRouble CURED.**

Mr. W. G. Weston, care of Messrs. Knott, Essex-street, King's-road, N.E., writes:—"I have used your 'Blood Mixture' for some time, and I feel in my health I have received through taking it."

amous "Clark's Blood Mixture." I have used it  
as many as 20 bottles, and it has done a terrible  
amount of good for me. I am now 35 years of  
age of 13. While an out-patient at one of the  
London hospitals a doctor informed me that my  
was the result of looking after foreign home.  
as many as 20 bottles of my cure, my  
being a horse dealer and jobmaster. He (my  
was speaking one day to a friend of mine who  
tioned that he was sick of "Clark's Blood Mixture"  
and was looking for a better cure. I told him  
continued, however, to suffer until April 4 last,  
my friend told me he was completely cured.  
I started to take "Clark's Blood Mixture" again  
and am completely cured after suffering and  
disfigured for several years. If I am able to follow  
employment, and am very pleased to think that  
such a simple cure has been found for a disease  
which I should be pleased to answer any inquiry  
concerning my case."—July 17, 1909.

### RESCUE MAKING.

—  
XVI.

3. "Has it ever struck you that there  
any. comparatively few successful biscuit-makers

one of the leading biscuit manufacturers of Sydney, who has devoted a lifetime to the industry, when some information was sought upon the industry.

"Why should it be so?" was the natural query.

"The reason I would give is that the maker like the poet is 'born not made.' The mail will probably smile at that, but it is nevertheless a fact. To become successful in the business a man must be possessed

something of a chemist, and also a student of foods and their effects upon the human system. He has a keen sense of the value of the various causes of small, a highly developed taste, and must above all things have an intuitive knowledge that will lead him more to hit upon what is right than to follow any universal public. Last, but not least in order to preserve unviolated his sensitive taste he must be a strict teetotaler." The last qualification seems to be unnecessary, but it has been our rare experience to find a man so good at capturing the calling.

Although biscuit-making is discredited and regarded by some as a branch of trade, it is still one of the most commanding, yet it is in reality quite distinct. It is conducted under very different conditions, and requires technical skill and experience peculiar to itself. It is not a matter of taste, but of "a kind of hard, dry, fat bread." It sounds very simple. If the biscuit, if the Australian damper, were composed of flour

of skill would, of course, be required to produce it. But it is necessary that bread should be made so that they can be prepared for a long time, and moreover, that it should hit the popular tastes, and not be palatable, but nourishing. The ingredients of which flour is composed, such as water, yeast, and various elements, milk, eggs, sugar, butter, and basic elements, etc., are also extensively used. And it is in the selection and blending of these ingredients that the difference lies. When it is remembered that the average quantity of flour required to produce good blisnet from inferior flour will be at once seen that the success of blisnet manufacture must be a good judgment of this constituent. A table of the percentage of gluten obtained by well-known experts from a large number of samples of flour is given below, showing that the average attention has to be paid to the existence

amined," said the biscuit manufacturer referred to, "almost every flour mill in Australia in order to ascertain that which is most suitable for our purpose, and to know whether the chemical analysis applied with butter. All the flours we use are subject to chemical analysis, and we have learned that the article milled from wheat grown in a certain district in our State is the most adapted for our purpose."

"What district might that be?" was the question of the writer, to whom the remarks were addressed.

The only reply was a smile and a sagacious shake of the head, followed at length by a naive remark, "There are some points in biscuit-making upon which we must leave you to judge."

Not only has the utmost attention to be paid to the quality of the flour used, but sugar, butter, milk, etc., all undergo

none of these is purchased without careful analysis.

It is today remarked there are but few cult-makers in New South Wales. The old one is Sydney firm of Arnott's, whose name is almost a household word, and who have a large share of the business. They are the general public, but have for many years manufactured a biscuit which delights children, and at the same time contributes to their nourishment. Having the central factory at Newcastle, they have a branch in Sydney to establish a branch at Camperdown for the production of the biscuits, which will probably some day replace in size the old factory at Newcastle.

The machinery required for the biscuits is inordinately complicated. Under the guidance of Mr. J. B. Aulsebrook, the whole process was witnessed at his firm's factory, Camperdown. First, a huge hopper con-

the biscuits was inspected. This ingredient which is made from the husks of wheat through a grinding machine, and being being reduced to powder as fine as sift flour, it is by the same machine blown into a funnel into another large hopper. The next process to be seen was mixing the dough. The mixer is a large circular vessel in which the dough of knives or arms is kept revolving. This, in a very short space of time incorporates the flour, water, and other ingredients into a stiff dough. From the mixer the dough is delivered on to nine tables, large and small, where it is kneaded and pressed by a machine with two heavy steel wheels. It travels backwards and forwards there until it is flattened out into plaques or sheets of uniform thickness. Another process then receive it, and after several passes through a machine, the result comes out in beautifully smooth thin flakes of uniform thickness.

and final impression. From what are known as the gauge rollers it is carried forward to the punching apparatus in which moulding cutting edges are arranged according to the desired size and shape of the biscuits. This is a most interesting operation. As the biscuits are cut out the scrap or remaining portion hangs together like the most delicate lacy work. In passing they are caught on a roller in the form of a circular band and carried over a pulley over a roller. The biscuits are then returned to the rollers, from which they are returned to the rollers. The machine to be once more transformed into sheets. The biscuits continue to be carried along by another web, and fall evenly on trays which are fed into the underpan of a pack of machines by a boy. These trays are filled or are wiped, and stored in a bin. The biscuits are of various shapes, and are of various sizes, and are of various thicknesses or otherwise of the same size, move forward exactly at the same rate, and the biscuits

being placed on the moving band and for conveyance to the ovens. The patent travel ovens are fitted with endless webs of plaited chains, and the rate at which the biscuits move and the degree of richness of the crumb is controlled by the speed of the travel. The whole length of the oven varies considerably. The temperature of the ovens has, of course, to be adjusted to suit various qualities and sizes of biscuits. Having been baked, the biscuits on the endless chains are delivered at the other end by boys, who turn them into clean white baskets, and as each basket is filled it is placed on a revolving lift for machinery, whence they are carried to the conveyor above. The conveyor is a "four-pipe" mechanism, go up on the left, and come down on the right, and so on to either the ovens or the packing department.

The packing and labelling department was next visited. Here a number of neat

labeling time. Wanting others, with Gettag's help, to make the same mistake, he has decided to label tin to distribute to the consumer. The stamping machine is a clever invention. The labels for the tins are pasted by passing them between two machine rollers, and are then conveyed along to the girls using them by a webbed belt. Twenty girls are thus supplied with labels, and the lack and the advantage of the old method of daubing with hand brushes are obvious.

Next the manufacture of dainty pink wafers was witnessed. The beautiful pink liquid is poured into moulds fixed on to a rotary machine, which carries them over a cooling plate. The wafer is then covered with a fine layer of chocolate. The whole miniature oven completes the process and turns to the operator a crisp blank stamp, with the maker's name, and bearing a cross-hatched pattern with which all consumers of this dainty are familiar. In the

**EVERY WISE MOTHER**  
Should be interested in our new Illustrated Art Booklet, entitled—

It tells just what you should know regarding an important question—that of your milk supply—its dangers—and how they may be safeguarded.

These rocks comprise an upper layer of a fine sand, which is the result of the formation of a sandstone of white powdery sandstone, and is composed of a sum-  
 ment in a vitreous looking ground, the composition of the sandstone is as in all respects to the opal-  
 inefinite. The previous stone is a crystalline manner through the opal-  
 in a nodular form.  
 The good specimens of the gem-  
 variety which exhibits a play of  
 of a fine mosaic, and has been  
 opal, and also one small speci-  
 men of the opal, and the opal of  
 the opal had a deeper than those  
 and in this respect more glossy  
 and in this respect more glossy  
 to be developed, and the prospects  
 mining, but I would caution men  
 to assist to support themselves for a  
 a few months, and then the most  
 miners who have had experience  
 as, already stated, the condi-  
 tion of the opal, 20 men are at work, but  
 at earning wages, and are at  
 the same time to account the facilities  
 and difficulty of obtaining  
 the country between Walest

With your truly

ALLOWS YOU TO SLIP THE AXE INTO YOUR  
POCKET. SMALLEST SIZE WEIGHS A POUND, AND  
HAS LITTLE HANDLE, A HANDSOME AND USEFUL  
KNIFE-AXE. PRICE, FROM 6s. OF EACH.

**W. JNO. BAKER, CUTLER, 3 HUNTER-ST.**

**MILK EPIDEMICS.**

"Milk Epidemics" was the subject of a lecture delivered by Dr. Armstrong, City Health Officer, last night before the members of the Sanitary Inspectors' Association of New South Wales. The lecturer dealt with the subject purely from a sanitary inspector's point of view, describing the best means of detection, and the suppression of milk-born epidemics, such as typhoid fever, scarlet fever, and diphtheria. The most useful weapon they possessed for dealing with such epidemics was the notification of infectious diseases.

**EDUCATIONAL.**

**B**LUE SPRING, springwood.—Perfect climate, Bathing, and "BATHING"—SPRINGWOOD LADIES' COLLEGE, under the supervision of MISS W. R. GIBBS, M.A., etc. Preparations for all exams. Prospectus free.
